

1. The reason the third element of an array is at index `**2**` is that array indexes begin at `**0**`.
2. The array ``quantities`` is a 20-element integer array.
3. The ``heights`` array is a double array with the values 1.65, 2.15, and 4.95.
4. A for-each statement iterates the ``grades`` array and prints every value.
5. If you pass an entire array, a method can access and modify all the elements in that array; if you pass just one element, you can only pass the value of that element.
6. Offset indexes are used to begin accessing a particular array at a position other than the first one.
7. The output is `**i**` because the character at position 3 of "Elaine" is ``i``.
8. A dynamic array is preferable in a situation where the number of elements in a collection may increase and/or decrease.
9. ``ArrayList.indexOf()`` method internally uses ``equals()`` method to compare objects, and returns the first matched index, or ``-1`` if not found.
10. Comparing objects of the wrapper class can be done using ``compareTo()``, ``equals()``, or by converting them to primitive values.
